The clothes that make you feel cool in summer and warm in winter keep the body temperature at an ideal level, and also dry quickly and rapidly remove the feeling of uncomfortable wetness caused by sweating. Pillout's light and breathable structure offers its users comfort and freedom of movement.

## A better world is possible with our choice...

The process of production, purchase, washing and wearing out of a garment involves a large workforce and economic system. Resources such as clean water and energy are rapidly consumed in production and the environmental effects of this excessive consumption is reaching threatening levels. Research shows that extending the lifetime of a garment creates a very high positive value in both economic and environmental terms.

Studies\* have shown that an increase in the average lifetime of clothes by just 9 months results in 33% longer use. Through this the carbon footprint is reduced by 27%, 2million m<sup>3</sup> of water is saved and a 22% reduction in the amount of waste is achieved. This shows that £5 billion could be saved in resources used to supply, wash and dispose of new clothes.

Pillout products help reduce new production processes by reducing the need for a new product with the advantage of its long lifetime. Thanks to the products that remain as on the first day with their anti-pilling and non-deforming structure, consumers keep enjoy their clothes and contribute positively to the environmental impact.

Customers who choose Pillout products are also supporting minimal use of natural resources by reducing the need for new products and they know that their product can make a difference and that a better world is possible with their choice.

\*Valuing our clothes: the evidence base, WRAP, 2012.
